

## **Keep Networks Clean with Tools4ever's ADUCAC**

*Trace inactive accounts with a simple click of a mouse!*

New York, December 7, 2010 –Tools4ever, a global leader in Identity and Access Management, introduces a new product that allows administrators to keep the Active Directory 'clean'. AD User & Computer Account Cleaner (ADUCAC) is an application that provides administrators the ability to trace inactive user and computer accounts inside the Active Directory environment based on the last logon date. After scanning all domain controllers in the network, ADUCAC offers administrators the ability to disable or enable selected accounts or move them to another Organizational Unit (OU). After the clean-up, inactive user and computer accounts will no longer impose a burden on resources (licenses, storage, management) of the network and unauthorized logins of former employees are prevented.

Inactive user accounts result in a major burden on capacity resources in the network. The high amount of inactive user accounts in organization is a result of not or late notifying the IT department when an employee leaves the company. The organization does not feel the impetus to inform the IT department about the employee leaving the company. Using ADUCAC, the IT department can easily trace inactive user accounts and disable them with a simple mouse click to prevent a burden on capacity resources in the network.

"Our mission is to develop products that make life easier for system administrators and this is certainly is the case with ADUCAC", said Dean Wiech, managing director of Tools4ever Ltd. "In order to disable, enable or relocate inactive accounts, administrator now often use complicated scripting. This is not only complex but, time consuming work. Using ADUCAC these activities are automated, helping the IT department to become more efficient and increase productivity.
